

Phase II: *Orbital Monitoring Array*

Orbital Monitoring Array is in fact a large volume of smaller satellite, which have single, dual or multiple purposes from detection, tracking, analysis, tagging, and if necessary engage the targets. They may act on their own, or within groups to accomplish their tasks.

Since time is one of the most vital considerations, the launching of these mini units will occur at the rate of production, and provide a bar-bones safety-net, until the launching of the Phase III Large Monitoring Arrays, which will provide a much more secure safety net to ensure the survivability of our assets.
